TITLE: Concrete constructions reinforced with prestressed reinforcement. (Zhelezobetonnye konstruktsii, armirovannye strunobetonnymi elementami).

PERIODICAL: "Beton i Zhelezobeton" (Concrete and Reinforced Concrete), No.3, 1957, pp.77 - 86 (U.S.S.R.)

ABSTRACT: In prestressed constructions the concrete is much sooner subjected to compression on the entire cross-section than in ordinary concrete. Fibres compress under the effect of external loading. Various constructions are subjected to prestressing often only in those parts of the section which require it due to the conditions of stresses and to avoid cracking. Table 1 gives normal stresses of a cross-section reinforced in the usual way with the prestressed reinforcement at the bottom, and double prestressed reinforcement (top and bottom) and finally with a prestressed reinforced core. It can be seen that the best utilisation of concrete is obtained under the last mentioned conditions. Combined constructions consisting of pretensioned precast bottom units, both solid and hollow, often serving as formwork for the top part (which is ordinary, in situ, concrete) has recently been used to a large extent in the USSR. Various types of prestressed reinforced core elements are indicated as used during tests in VNIZHelezobeton.

Concrete constructions reinforced with prestressed reinforcement. (Cont.) 170

The length of anchoring of high-tensile prestressed reinforcement in core elements is given in diagram 4. The above named institute carried out a number of experiments with prestressed core units in beams, T-beams, solid slabs and with various types of hollow slabs. If satisfactory adhesion between the core and the surrounding ordinary concrete was achieved the combined construction has the same strength as with pretensioned reinforcement. Examples of calculating the stresses and the formation of cracks in prestressed reinforced constructions with differently situated core units are included. Constructional details of hollow floor slabs reinforced with prestressed core units are illustrated as well as slabs with ribs, assembled foundation blocks and flights of stairs to indicate the possible practical application of this method.

Manufacturing problems such as the layout of special workshops for prestressed prefabricated core-units and special plant requirements are discussed. There are 4 graphs, 2 diagrams, 8 constructional details, 1 layout of the workshop and 1 layout of the plant.

TITLE: Transfer of Stresses from Tensioned Reinforcement on Concrete.
(Perekada armaturoy predvaritel'nykh napryazheniy na beton)

PERIODICAL: Beton i Zhelezobeton. 1958. No. 1 USSR Pp 4-13.

ABSTRACT: The transfer of stresses in concrete begins at the end of prestressed concrete products (vide Figure 1). Stresses could be calculated from a formula of equilibrium as shown. Investigations of these stresses were carried out in the laboratories of VNIZhelezobeton under the leadership of E.G. Ratts. Associated with him were F.S. Belavin and L.P. Serova. Figure 2 illustrates various types of reinforcement used for tests and Table 1 tabulates characteristics of the reinforcements used. Tensioning in the reinforcements was measured by a "dynamometer" - DP-2. This instrument was constructed by the all-Soviet Scientific and Research Institute of the Ministry for Transportation Construction (Vsesoyuznyy Nauchno-issledovatel'skiy Institut Transportnogo Stroitel'stva Mintransstroya SSSR) (See article by N.M. Bogin in Beton i Zhelezobeton 1956 No.3) The measurement of the displacement of reinforcement in concrete was

Card 1/2

97-58-1-2/12

Transfer of Stresses from Reinforcement on Concrete.

carried out by a microscope, magnifying 120 times, with an ocular micrometer attached - AM-92. The accuracy of this instrument is 2-4 microns. Figure 3 illustrates laboratory testing equipment for casting pretensioned reinforced units. Figures 4,5 and 6 show graphs obtained during testing of stresses between reinforcement and concrete in prestressed reinforced testing samples with various reinforcements and qualities of concrete. Figure 8 shows relationship of described stresses as being the function of the depth of "setting in". Type TP reinforcement of 4 m.m diameter and various profiles was used. Figure 9 illustrates graphs giving empirical coefficients in relationship to the strength of the concrete. Distribution of stresses at the ends of testing units caused by tensions between reinforcement and concrete was investigated and formulae are given. Experimental checking of mathematical calculations and practical recommendations are discussed. Table 2 gives figures for lengths of anchoring zones for various profiles of reinforcement and Table 3 gives recommendations for actual calculation of the length of the anchoring zone of standard reinforcement. Figure 14 shows a curve defining lengths of the anchoring zone and Figure 15 the distribution of normal stresses in the reinforcement in the zone. There are 15 Figures and 3 Tables.

AUTHOR: Ratts, E.G. (Candidate of Technical Sciences)

TITLE: Precast, Prestressed Reinforced Concrete Constructions
With the Rod Reinforcement Tensioned by Electro-Thermal
Method (Predvaritel'no napryazhennyye zhelezobetonnyye
konstruktsii so sterzhnevoy armaturoy, napryagayemoy
elektrotermicheskim sposobom).

PERIODICAL: Beton i Zhelezobeton, 1958, Nr.11, pp.410-414 (USSR)

ABSTRACT: The mechanical tensioning of reinforcement by means of hydraulic jacks requires special equipment. In many factories, therefore, the tensioning is carried out by an electro-thermal method. This method is based on the fact that the rod undergoes elongation when heated by an electric current. When the required elongation is attained the ends are anchored, the required tensioning being produced on cooling. The first factory to introduce this method is in Chelyabinsk. A current producing a temperature of 300-400°C was used. It was necessary to insulate the reinforcement from the steel framework before applying the current. The advantages of this method lie in the

Card 1/5

SOV/97-08-11-2/11

Precast, Prestressed Reinforced Concrete Constructions With the Rod Reinforcement Tensioned by Electro-Thermal Method .

simplicity of the casting forms and of application under varying factory conditions. This method, however, requires the use of straight reinforcement and insulation. The NIIZhlezobeton and the factory Nr.12 of Glavmosznelezobeton devised and introduced an improved method of electro-thermal tensioning of rod reinforcement. The following technicians participated in the work: S.I. Mishin, E.G. Ratts, I.P. Barbarash, V.M. Gdalevich (NIIZhlezobeton), T.F. Konstantinov, A.K. Mkrtumyan, B.F. Gaysanyuk and M.L. Petrishin (factory Nr.12). Steel reinforcement Mark 30KhG2S or high tensile reinforcement Mark 25G2S can be tensioned up to 5000-5400 kg/cm². Requirements of "Instructions on Designing Precast Prestressed Reinforced Concrete Constructions" (SN 10-57) stipulate the degree of tensioning and allow for small cracks in the concrete. Various types of building constructions are designed for tensioning up to 3000-3500 kg/cm² which take into account these small cracks. Consequently these precast prestressed reinforced concrete constructions can have an initial

Card 2/5

SOV/97-58-11-2/11

Precast, Prestressed Reinforced Concrete Constructions With the
Rod Reinforcement Tensioned by Electro-Thermal Method

tensioning within the limits of $3000\text{--}5000 \text{ kg/cm}^2$. Tensioning corresponds to an elongation of 9 to 15 mm for a 6 m long reinforcement rod. The heating is carried out using welding transformers. Three to six rods are heated simultaneously. The electrical contacts are so positioned that the rods remain cold 400 to 600 mm from the end of the rod. The heating installation has automatic switch-off arrangements which operate when the required elongation has been obtained. The latest heating device has pneumatic clasps which prevent the fusing of steel at the location of the electric contact. The automatic control of elongation is necessary as rods made from high-tensile steel Mark 25G2S or St5 should not be heated above 350 to 400°C. Tests proved that when 14 mm diameter rod reinforcement of standard cross section is used for hollow floor slabs, the strength of the concrete should be not less than 140 kg/cm^2 . Near the ends it is necessary to use mesh-reinforcement for the hollow beam slabs (Fig.3). Further tests were carried out on 0.8 m

Card 3/5

SOV/97-58-11-2/11

Precast, Prestressed Reinforced Concrete Constructions With the
Rod Reinforcement Tensioned by Electro-Thermal Method

wide floor slabs with four cavities reinforced with steel 30KhG2S of 14 mm diameter. The initial tensioning was found to vary not only in various slabs but also in the same slab. In one case, for example, one bar was stressed to 5000 kg/cm² and two others to 3000 kg/cm² each. In this case the resultant stress is equal to the mean stressing of the bars. Factory Nr.12 of Glavmoszhelezobeton is manufacturing floor slabs 0.8 and 1.2 m wide and 5.9 and 6.3 m long, cast in metal forms. Fig.4 shows various types of anchoring which is welded to the ends of the bars, and saddles fixed to the forms. The factory "Barrikada", Leningrad, is using wedge shaped clips which are removed after the concrete has set and can be re-used. In the early days of mass production of hollow floor slabs by this new tensioning method the actual tensioning of the reinforcement was controlled by the Laboratory for Precast Reinforced Concrete Constructions, NIIZhelezobeton (Laboratoriya sbornykh zhelezobetonykh konstruktsiy NIIZhelezobeton) in the factories Nrs.4, 6 and 12, and in

TITLE: The possibility of using the multifunctional properties of zeolites in a
physical and chemical air-regeneration system

SOURCE: Konferentsiya po kosmicheskoy biologii i meditsine, 1964. Materialy. Moscow,
Inst. mediko-biol. problem, 1966, 81-84

TOPIC TAGS: life support system, closed ecological system, space biology

ABSTRACT: A physical-chemical air "regeneration" system which has been proposed for
manned spaceflight is shown in Fig. 1. In this system CO₂ is removed from cabin air
by adsorption on zeolite. The carbon dioxide then undergoes vacuum desorption from
the zeolite and passes through a CO₂ collector to the catalytic reactor, where it
is reduced with hydrogen from the electrolyzer to water and methane. The water returns
to the electrolyzer and is broken down into oxygen (used for human
respiration) and hydrogen. The disadvantages of this method are the difficulties of
creating a vacuum on board a spacecraft and the additional electrical energy required
to operate the CO₂ collector. Studies have shown that specially treated B-zeolite

Card 1/3

L 45066-66

ACC NR: AT6030697

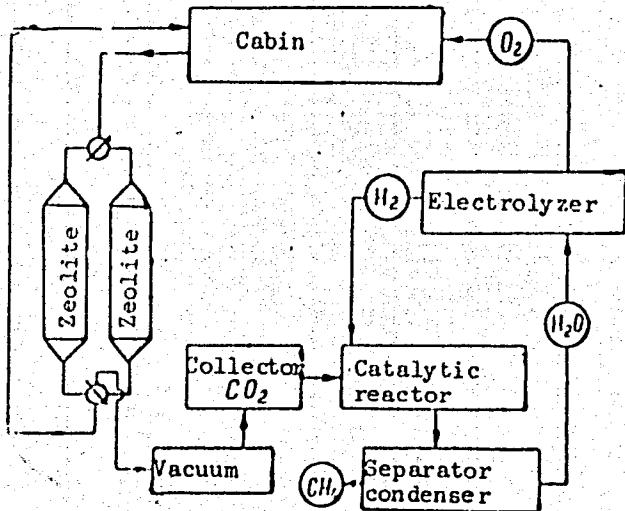

Fig. 1. Schematic diagram of a physical and chemical air "regeneration" system

can be used in such a system for both sorption and catalysis, retaining its properties through a number of cycles. An improved air "regeneration" scheme using B-zeolite is shown in Fig. 2.. Cabin air is purified by passing through a B-zeolite

Card 2/3

L 45966-66
ACC NR: AT6030697

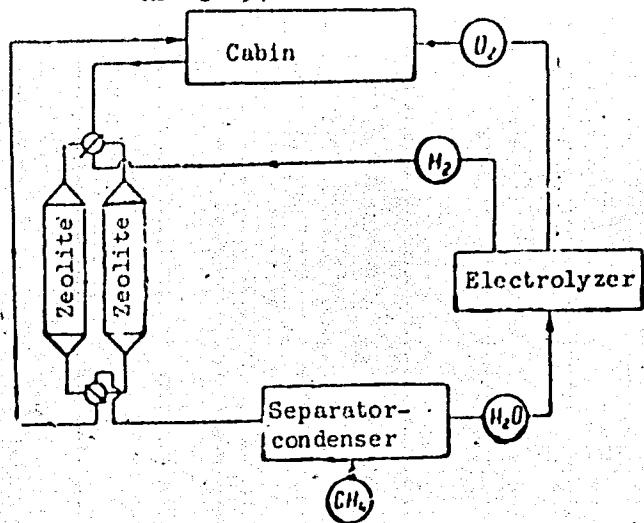

Fig. 2. Schematic diagram of a physical-chemical air "regeneration" system using B-zeolite

adsorber. Hydrogen derived from electrolysis is then passed through zeolite in a second adsorber, simultaneously desorbing CO₂ and reducing it to water and methane. The water is electrolyzed as in the first system. Temperature regulation is very important for the successful operation of this system, since a 7-12°C temperature variation alters the gas conversion level by 10-15%. Orig. art. has: 3 figures. [JS]

PERIODICAL: Zavodskaya laboratoriya, 1959, Vol 25, Nr 9, p 1100 (USSR)

ABSTRACT: Ye. A. Ratsbaum, Leningradskaya lesotekhnicheskaya akademiya im. S. M. Kirova (Leningrad Academy of Forestry Engineering imeni S. M. Kirov) proposes the use of an interrupted arc for the quantitative spectral analysis of OTsS bronze. The electrode moves up and down and interrupts the arc 7 times per second. The arc is fed by an alternating-current generator of the PS-39 type with amperage of 3 a. Spectrographic analysis is made on a spectrograph of medium dispersion under exposure of 2 minutes. The following analytical lines are used: Zn 3075.86 - Cu 3075.80 , Pb 2833.06 - Cu 2882.93 , Sn 2913.54 - Cu 2882.93 .

TITLE: Preparation of polyolefins / Class 39, No. 178982. [announced by State Scientific-Research Institute of Polymerization Plastics, Experimental Plant (Gosudarstvennyy nauchno-issledovatel'skiy institut polimerizatsionnykh plastmass, eksperimental'nyy zavod); Central Scientific-Research Laboratory of Reagents (Tsentral'naya nauchno-issledovatel'skaya laboratoriya reaktivov)]

SOURCE: Izobreteniya, promyshlennyye obraztsy, tovarnyye znaki, no. 4, 1966, 69

TOPIC TAGS: olefin, polymerization, polymer

ABSTRACT: An Author Certificate has been issued describing a method of obtaining polyolefins by polymerization of Alpha-olefins in a medium of an inert hydrocarbon solvent with heating in the presence of a catalyst consisting of a mixture of dialkylaluminum chloride and a heavy metal compound. To speed up the process of polymerization and expand the variety of heavy metal compounds, chelate derivatives of orthovanadic acid are suggested under the general formula $VO(OR)(OX)_2$, where R is the hydrogen or alkyl and X is the remainder of the chelating agent. Methylether of vanadium orthohydroxyquinate is the chelate derivative of orthovanadic acid suggested for use. [LD]

TITLE: Contactless magnetic memory element 16C

SOURCE: Priborostroyeniye, no. 4, 1966, 10-11

TOPIC TAGS: computer storage, storage device

ABSTRACT: Two variants of a contactless magnetic memory element are described: one with a d-c output and one with an a-c output. Schematics of both are shown in Fig. 1. The elements utilize magnetic cores with rectangular hysteresis loops. The output circuits for both variants consists of two windings W connected in parallel, diode bridge D₁ - D₄, and a voltage feedback circuit consisting of winding W_f limiting resistor R_o, and silicon Zener diode D₅. The input signal is applied to control winding W_c. The Zener voltage must be less than the maximum bias voltage. The circuits have two states, characterized by high and low output voltages. Test models had the following operating parameters: input voltage, 15 v, 400 cps; 50 NP perm-alloy core dimensions, 30 x 20 x 5 mm; W, 800 turns; W_f, 700 turns; W_c, 230 turns; D₁ - D₄, diodes, type D207; D₅, D808; load resistor R_l = 620 ohm; limiting resistor,

a - With d-c output; b - with a-c output.

$R_o = 10 \text{ ohm}$. The output voltages for the two states were 15 and 1 v. Input current (d-c) was 30 mamp. The allowable bias voltage variation for faultless performance was 15 v + 10%, - 20%. The circuits have relatively high output power levels and the power is consumed only during the write and read periods. Orig. art. has: [BD]

TITLE: Contactless magnetic relay with automatically controlled feedback

SOURCE: Priborostroyeniye, no. 7, 1965, 14-15

TOPIC TAGS: magnetic relay, contactless relay

ABSTRACT: A new contactless magnetic relay (Author's Certificate no. 163677, "Byull. izobr.", 1964, no. 13) is described which is based on a magnetic amplifier having internal and external feedbacks and equipped with an additional feedback winding. A Z sner diode is connected in series with the latter; when conducting, the diode automatically reduces the feedback ratio thereby reducing the relay release current and the width of the relay characteristic loop. Tests of an experimental model revealed these characteristics!

Orig Pub : Vinodeliye i vinogradarstvo SSSR, 1957, No 4, 24-27

Abstract : It was found that Transcaucasian diatomite from the Akhaltsikhskij pit can be used without preliminary calcining for clarifying wine by filtration. It is sufficient to grind the diatomite and treat it with dilute H_2SO_4 . In the clarification of wine with the use of such diatomite no changes take place in the pH, the content of Fe and cathions that are precipitated by ammonium oxalate, or in the organoleptic properties of the wine.

*✓ Quinazoline alkaloids. V. Dipole moments and configurations of (\pm)-3-lupinine and (\pm)-epilupinine. Josef C. Ratvusky, Anton Reiser, and Frantisek Sorm (Czech. Acad. Sci., Prague). Chem. Listy 48, 1704-8 (1954); cf. C.A. 49, 3388j. From dipole moment measurements (in Decbyres) of (\pm)-lupinine m. 50° (3.07 D.), (\pm)-epilupinine, m. 81° (2.20), (\pm)-3-lupinine (Ia), m. 50° (2.83) and (\pm)-3-epilupinine (Ib), m. 30° (2.12), it was deduced that Ia possesses configuration *a* and Ib configuration *b*. A new synthesis of Ia and Ib is described. Hydrogenation of 34.3 g. di-Et [2-(2-pyridyl)ethyl]malonate in 40 ml. AcOH and 30 ml. EtOH over 2 g. PtO₂ 20 hrs. at normal conditions, evapn. of the solvents, washing of the residue with H₂O and NaHCO₃, and extn. with Et₂O gave di-Et [2-(2-pyridyl)ethyl]malonate (II), viscous oil, cyclized to Et [cyclohexa-4-oxo-3-quinolinesuccinate] by distn. Treating 8.9 g. II in 60 ml. H₂O alkalinized to pH 8-10 with Na₂CO₃ with an equiv. amt. of 40% HCHO (2.66 ml.) 2 days at room temp., evapn. the soln. *in vacuo* below 50°, extg. the residue with ether, and evapn. the solvent gave viscous oil, probably a HOCH₂ deriv. of II. Distn. at 180-200° *in vacuo* gave 3.4 g. (86.6%) Et octahydro-3,3-quinolinesuccinate (III), b.p. 125-35°, b.p. 122-3°. Also obtained in 87.5% (3.0 g.) yield by treating 4.28 g. II with 1.44 ml. 40% CH₂O in 9 ml. C₂H₅N. Shaking 5.8 g. III in 50 ml. N NaOH at room temp. overnight, neutralizing the soln. with HCl, heating it 3 hrs. on the steam bath, alkalinizing, extg. with Et₂O to remove octahydro-4-oxquinolizine, acidifying with HCl to Congo red, evapn. *in vacuo*, dissolving the residue in 50 ml. abs. EtOH, satg. the soln. with HCl, repeating the esterification twice more, evapn. the mixt. to dryness, neutralizing the residue with the min. atm. of aq. NaHCO₃, adding dry Na₂SO₄, boiling the ppt. several times with Et₂O, evapn. the solvent, and distg. the residue gave 2.5 g. (85%) Et octahydro-3-quinolinesuccinate (IV), b.p. 112-14°.*

Dissolving 2.8 g. IV in 60 ml. Et₂O, adding 0.8 LiAlH₄ in 30 ml. Et₂O, decomp., the mixt. with H₂O, extg. with Et₂O and distg. the ext. gave 1.9 g. (85%) 3-(hydroxymethyl)octa-hydroquinolinizine (mixt. of Ia and Ib), b.p. 95-7°. In the chromatography over 100 g. alk. Al₂O₃, the petr. ether fractions gave Ia, m. 59°, and the ether fractions yielded Ib, m. 30°. The dielec. consts. were measured at 25°. Also in *Collection Cechoslov. Chem. Commun.* 20, 798-803 (1955) (in English). M. Hudlický

120, 26/01, no. 100972, 15. 09. 61 (Czechoslovak
patent))

TEXT: A method is proposed for the preparation of high-molecular semiconductor compounds by thermal decomposition of salts of acetylene-carbonic and polyacetylene-carbonic acids, followed by aqueous extraction of the decomposition products and drying. As an example, the decomposition of non-aqueous acetic acetylene-dicarbonate is described, which is neutralized by acetylene-dicarbonic acid. The decomposition is carried out at 285-295°C. After cooling, the obtained mass is triturated, washed with water, filtered and dried. The electrical conductivity of the obtained material is $0.7 \cdot 10^{-4}$ ohm⁻¹·cm⁻¹ at 20°C.

 TITLE : On the Mechanism of the Rearrangement of Potassium Phthalate and of the Carboxylation of Potassium Benzoate
 CRIG. PUB. : Collection Czechoslov Chem Commun, 24, No 8, 2553-2559 (1959); Chem Listy, 52, No 12, 2328-2333 (1958)
 ABSTRACT : The mechanism of the rearrangement of K phthalate (I) to K terephthalate (II) and of the carboxylation of K benzoate (III) with the formation of II has been investigated. The rearrangement of I under an atmosphere of C^{14}O_2 gives active II. The heating of I with C^{14}O_2 to the reaction temperature in the absence of the catalyst or with the catalyst but at a lower temperature does not give active II. II labeled with C^{14} in the carboxyl group practically does not lower the activity in an atmosphere

 ABSTRACT : of CO_2 [sic], from which the authors conclude that the reaction $\text{I} \rightarrow \text{II}$ proceeds as an intermolecular reaction with the participation of the CO_2 atmosphere. It is hypothesized that the reaction begins with the ionization of I to give a carbanion (IV) with an unshared pair of electrons in the ortho-position to the carboxyl group and K^+ ; IV rearranges into the more stable isomer with an unshared electron pair in the para-position (V), which subsequently adds CO_2 and K^+ to give II.

Mechanism of the rearrangement of potassium phthalate and carboxylation of potassium benzoate. Josef Ratusky and František Sorm (Českodolov, akad. věd, Prague). Chem. Listy 52, 2228-33 (1958).—Heating equimolar amts. of $C_6H_5(CO)_2O$ and $K_3C^1O_4$ with 10% powd. Zn 60 min. to 405° in a sealed tube in an autoclave yielded $\mu-C_6H_5(CO_2H)_2$, (I) contg. approx. 50% of the specific activity of CO_2 used in the reaction. Heating similarly an equimolar mixt. of BzO , $K_3C^1O_4$, and Zn 30 min. to 410-25° gave I contg. 65.5% and $PhCO_2H$ contg. 33.5% acit. On the basis of this evidence as well as of expts. with changed conditions, the authors suggest that in the course of thermal rearrangement of K phthalate only 1 CO_2H group of its mol. undergoes statistical exchange with CO_2 from the reaction atm. In the carboxylation of $PhCO_2K$ a fast reaction primarily results in statistical exchange of the benzoate CO_2H with labeled CO_2 and the carboxylation proceeds in the further step with benzoate already labeled with C^{14} . Reaction mechanisms are discussed.

Title : Reactions of Diazoketones. II Reactions of WO-diazoacid Esters With Indole and N-methyl-pyrrole.

Orig Pub : Chem. Listy, 1957, 51, #6, 1091-1100.

Abstract : Ethyl (Ia) and methyl (Ib) diazopyroacetate, as well as ethyl γ -diazoacetoacetate (II) and δ -diazolevullinate (III) were synthesized. The reactions of these compounds with indole (IV) and with methyl pyrrole (V), in presence of Cu, were studied. In both cases substitution of H by an ester radical takes place with elimi-

nation of N_2 , examples in (IV) in the 3rd position, and in (V) in the 2nd position. The structure of diazo compounds (DC) was proven by reactions with hydrogen halides, CH_3COOM and by Wolf's rearrangement. DC were synthesized by stirring an ether solution of CH_2N_2 with a corresponding ester chloride for 30 min., at -5 to -8°. Listed below are: % yield, M.P. in °C, or B.P. °C/mm and derivative: Ia, 90.2, 73-74, ethoxyallyl chloride; Ib, 90, 103-105, methoxyallylchloride; II, 77, 70/0.05, $C_2H_5OCOCH_2COCl$; III 82, 75/0.01, $C_2H_5OCOCH_2CH_2COCl$. Reaction with IV was accomplished by introducing DC into a solution of IV in the presence of Cu (85-95°C, 5-10 min.). From a solution of I in

over Al_2O_3 . Upon boiling of the latter (1 hour) with a 30% KOH 3-indolyl acetate, M.P. 165° was formed. III in cyclohexane led to ethyl γ -3(indolyl)-levullinate, 86% yield. Oxidation with O_2 yielded indole carboxylic-3 acid, detected by chromatography on paper. Reactions of V are analogous, but take from 0.5 - 2 hours (the extent of reaction being determined by the quantity of liberated N_2). I without a solvent yielded ethyl 2-(N-methyl pyroyl) pyroacetacetate, 39% yield B.P. $110^\circ/0.25\text{mm}$ which yielded with a 3N NaOH 2-(N-methylpyroyl) pyroacetacetate, M.P. 112° . From II in cyclohexane may be obtained ethyl γ -(2-N-methyl pyroyl)-acetacetate, 23.2% yield, B.P. $90^\circ/0.5\text{ mm}$. Heating of the latter for 15

min. resulted in the formation of 2-N-methyl-pyroacetone, (semicarbazone), M.P. 166°. III in C₆H₆ yielded ethyl δ -2-N-methylpyroaryl levullinate, 65.8% yield, B.P. 114°/0.2 mm. In order to prove the structure of DC the following compounds were synthesized: methyl ethyl chloropyroacetate from Ib and HCl (g) in CH₃OH, 94.5% yield, B. P. 78°/13 mm which with a 35% HCl (acid) gave chloropyroacetic acid, M.P. 57°; ethyl bromopyroacetate, B.P. 87°/9 mm, obtained by shaking Ia in ether with a 40% HBr. At the same time bromopyroacetic acid, M.P. 75° was formed. By analogy, II and HCl (g) yielded ethyl γ -chloroacetoacetate, 66.5% yield. B.P. 95°/10 mm, n₂₀ D 1,4550 (tear gas), while II
